SteelCentral NetProfiler

Centralized network performance analysis and reporting

The Business Challenge

Today, network operations engineers are expected to be application-fluent. They need a deeper understanding of the applications running on the network and what end users are actually experiencing. So when applications are slow or fail, network managers must go beyond simply proving that the network is not at fault and start looking at the problem through the lens of the application.

When users complain about performance problems you should have no trouble identifying what they are experiencing and giving business owners a good picture of the actual response time and how that relates to the network. More, and more, varied people within companies are interested in application performance. The time has come to convey network performance details to them in a way that they’ll understand.

The Riverbed Solution

Riverbed® SteelCentral™ NetProfiler is a centralized reporting and analysis console that you can use to quickly view network and application performance and troubleshoot issues before your end users ever know there’s a problem. SteelCentral NetProfiler combines network flow data with packet-based flow metrics to provide proactive monitoring, analysis, and reporting.

Use NetProfiler to answer questions such as how much traffic do I have, who is using it, where is it going, and how is it prioritized?

SteelCentral NetProfiler collects information from:

- Riverbed® SteelCentral™ AppResponse 11 network-based application performance management
- Riverbed® SteelCentral™ NetShark high-speed packet collection
- Riverbed® SteelCentral™ Flow Gateway flow collectors
- Riverbed® SteelHead™ WAN optimization
- Riverbed® SteelFusion™, a platform for edge IT
- Flow-enabled devices such as routers, switches, firewalls, and proxys

NetProfiler uses automated discovery and dependency mapping to understand the application services in your environment and automated behavior analytics to baseline normal performance and alert you to changes as soon as they occur—typically before users are even aware that performance is degrading.

In addition to providing rich insights on network usage, NetProfiler also provides deep application visibility that enables you to effectively monitor performance and ensure service levels for applications.
SteelCentral NetProfiler integrates with several other SteelCentral solutions to enrich your every day IT operations functions.

These one-click integrations include:

- Riverbed® SteelCentral™ AppResponse: network forensics and application analysis
- Riverbed® SteelCentral™ Aternity: end-user experience monitoring from the device perspective

**Key Benefits**

- Improve user experience and productivity
- Enhance IT collaboration and operational efficiency
- Speed problem identification and resolution
- Increase application visibility and improve app performance

**Key Features**

**Application recognition and monitoring**

- NetProfiler offers three ways to create a custom application definition. You can map:
  - Hosts, host groups, protocols, ports to an application name
  - Auto-recognized applications to an application name
  - URLs to an application name

- Deep packet inspection of application traffic from SteelCentral AppResponse 11, SteelCentral NetShark and SteelHead for easy viewing and analysis in the SteelCentral NetProfiler dashboard to help you quickly and accurately distinguish business-critical from recreational applications that are running across your network including the optimized WAN

**Automated analytics**

- Uses baseline statistics and proactive monitoring to trigger an alert once a deviation is detected, without prior knowledge of specific applications, path dependencies, and number of users or even router changes

---

Figure 1

SteelCentral NetProfiler dashboards include everything you need to know from the highest level to the most granular detail with one-click drilldown for root cause and problem isolation and deep application visibility.
SD-WAN visibility
• Ensure the success of your SteelConnect SD-WAN environment by validating policies are working as expected, troubleshooting problems quickly, and enabling better planning
• Requires SteelCentral Insights for SteelConnect

Discovery and dependency mapping
• Includes a discovery wizard that creates application dashboards to automate the process of mapping transactions to their underlying infrastructure so that application definitions and interdependencies are accurate—including discovering through F5, Riverbed® SteelApp™ Traffic Manager and other application delivery controllers (ADCs)
• Creates service maps for accelerating troubleshooting across complex application ecosystems, and planning for data center consolidation or cloud, disaster recovery, and virtualization initiatives

WAN optimization analysis
• Robust analysis of optimized WAN environments enable you to easily plan your optimization deployments, assess the impact, and quantify benefits
• Cost-effective troubleshooting of branch issues using a single product for visibility, control and optimization
• Centralized reporting and monitoring of SteelHead quality of service (QoS) site and classes
• Rich application visibility/monitoring through deep packet inspection (DPI)

Streamlined workflows
• One-click dashboard creation creates NetOps-centric, application-specific, SteelHead WAN optimization-specific, and VoIP-related dashboards that quickly surface relevant data and streamline troubleshooting workflows

Related Products
SteelCentral Flow Gateway
NetProfiler requires one or more Flow Gateways to collect flow from across the network

SteelCentral Portal
NetProfiler provides SteelCentral Portal with network-centric information such as Top Interfaces, Top Talkers, etc. to contribute toward a true end-to-end view of application performance

NetProfiler can accept packet-based flow data from the following sources:

SteelCentral AppResponse 11
Network-based application performance management that integrates network forensics and historical analysis, application analytics and end-user experience monitoring

SteelCentral NetShark
Continuous, high-speed packet capture, indexing, and storage

SteelCentral AppResponse with NetShark Module
Network-based application performance management that integrates historical network analysis, application analytics and end-user experience monitoring

SteelCentral NetIM
Seamlessly marries network data with SNMP information so you can access device metrics directly from the NetProfiler interface

SteelHead with NetShark Virtual
The industry’s #1 WAN Optimization solution

SteelFusion Edge with NetShark Virtual
Software-defined edge with a hands-off, Zero Branch IT approach

Service monitoring
• Monitor all network and infrastructure components involved in delivering an application service such as users, Web servers, load balancers, application servers, authentication and DNS servers, databases, and the links between them
• Advanced analytics changes in performance, providing proactive notification of brewing issues
• Service dashboards provide a quick view into the end-to-end health of a business service that is visually shown by red-yellow-green health status indicators
• Guided drill down reveals details of the most critical applications and essential data for fast troubleshooting

Server virtualization and VMware NSX SDN
• NSX-aware IPFIX format enables SteelCentral products to provide detailed information about what NSX virtual overlay networks are running on the physical network, what applications are involved, and which hosts and virtual tunnel endpoints are generating the traffic

NetProfiler 10.10 is IPv6 and USGv6 certified, and can support both IPv6 and IPv4 addresses simultaneously.

Riverbed SteelCentral NetProfiler Data Sheet 3
Product Models

SteelCentral NetProfiler supports from 2 million to 200 million raw flows per minute.

SteelCentral NetProfiler Standard Edition
