

Zero Branch IT with Riverbed SteelFusion

Less hardware required at the branch

No dedicated onsite IT required

Increased data security

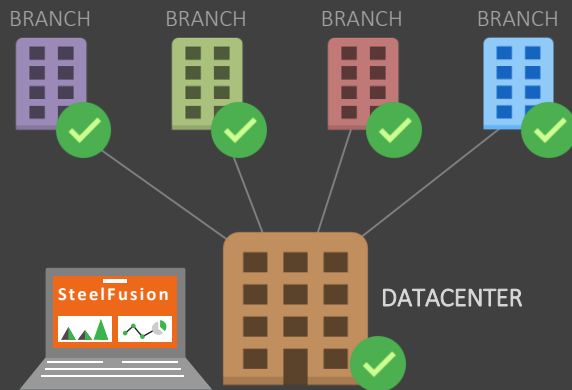

Apps or entire branch deployment and restoration take minutes

Investments in the data center *and* cloud are extended to the branch

RETHINK ROBO with SteelFusion

Why This Matters

- Deploying new branches for a distributed organization is complex, expensive, and time-consuming. Every branch site requires dedicated hardware, software, licenses, and, quite often, an IT administrator.
- ESG Lab validated that once a single SteelFusion Edge appliance was installed onsite, a branch office could be fully deployed and configured, and begin serving an end-user file server application in **less than 8 minutes**.
- All branch locations can be centrally managed and monitored from the data center.
- SteelFusion greatly lowers both CapEx and OpEx by eliminating dedicated branch office hardware software, licenses, management resources, and disparate IT processes.
